# 8th Annual Davis Math Conference 

## Schedule and Abstracts

Organizers: Kirill Paramonov and Jingyang Shu
January 11th 2018

## 1 Schedule

| Breakfast | $9: 00 \mathrm{AM}$ |  |
| :--- | :--- | :--- |
| Introductory Remarks | $9: 25 \mathrm{AM}$ | Jordan Snyder |
| Partial Differential Equations | $9: 30 \mathrm{AM}$ | Joseph Biello |
| Mathematical Physics | 10:05 AM | John Murray |
| Algebra | $10: 30 \mathrm{AM}$ | Erik Carlsson |
| Topology | 11:05 AM | Kevin Lamb |
| Number Theory | $11: 30 \mathrm{AM}$ | Elena Fuchs |
| Optimization | $12: 05 \mathrm{PM}$ | William Wright |
| Lunch | $12: 30 \mathrm{PM}$ |  |
| Computational Mathematics | $1: 30 \mathrm{PM}$ | Thomas Strohmer |
| Machine Learning | $2: 05 \mathrm{PM}$ | Kirill Paramonov |
| Mathematical Biology | $2: 30 \mathrm{PM}$ | Robert Guy |
| Combinatorics | $3: 05 \mathrm{PM}$ | Chaim Even Zohar |
| Department Tea | $3: 30 \mathrm{PM}$ |  |

## 2 Abstracts

### 2.1 Partial Differential Equations

## Joseph Biello

Title: The Non-linear PDEs of atmospheric fluid dynamics
Abstract: The PDEs of ideal fluids describe atmosphere and ocean dynamics. Open problems include the development of singularities and the effect of interaction across scales. I will discuss a few problems which are motivated by shear flows and organized waves in the tropical atmosphere. The PDEs I will describe (and show solutions to) are derived from the ideal fluid equations using systematic asymptotic analysis. Some of this work is joint with J. Hunter.

### 2.2 Mathematical Physics

## John Murray

Title: Higher Algebra and Quantum Field Theory
Abstract: Though the experimental predictions of quantum field theories are astoundingly accurate, we are far from having a complete mathematical description of these theories. We will explore a formalism using new ideas from higher algebra to advance us toward that goal. In particular, we will describe how one deformation quantizes functions on the simplices of a derived stack. From a physical perspective, this process defines perturbation theory about classical field configurations including those that model tunneling between vacua.

### 2.3 Algebra

Erik Carlsson
Title: TBA
Abstract: TBA

### 2.4 Topology

## Kevin Lamb

Title: Circular Distance for Knots in the 3-Sphere

Abstract: Knots can often be studied via their complements in the 3manifolds in which they sit. In turn, one of the main areas of study in 3 -manifold theory is their classification. One of the primary tools we use to classify 3 -manifolds is a decomposition into two handlebodies; that is, a Heegaard splitting of the 3-manifold. In 2001, Hempel showed that these splittings can be studied via Harding's curve complex. For any Heegaard splitting of a 3-manifold, we can define a combinatorial invariant for that splitting called its distance. It was then shown in 2002 by K. Hartshorn that if a 3-manifold contains an incompressible surface of genus g , then the distance of any Heegaard splitting is bounded by 2 g .

The aim of this talk is to show recent results that provide a notion of distance (the circular distance) for a class of Heegaard splittings (circular Heegaard splittings) of knot complements in the 3 -sphere. In particular, we show that Hartshorn's result extends to this setting; that is, if the knot's complement in the 3 -sphere contains an incompressible surface of genus g , then the circular distance of any circular Heegaard splitting of that complement is bounded by 2 g . We also state results for uniqueness of minimal genus Seifert surfaces and for circular thin position.

### 2.5 Number Theory

## Elena Fuchs

Title: Sieves and Expanders
Abstract: A problem that arises frequently in number theory is that of counting prime numbers given an interesting set of integers. Sieves are number-theoretic machines that have been used for centuries to estimate the number of primes in problems like these. In this talk, I will discuss how a seemingly unrelated object ? families of expander graphs ? feed into sieves in certain situations, and how this has led to some interesting number theoretic discoveries in the past few years.

### 2.6 Optimization

## William Wright

Title: An Eigenvalue Optimization Method for Phase Retrieval
Abstract: Phase retrieval is the process of recovering the phase of an unknown signal using only the magnitudes of some signal observations. Some common applications are X-ray crystallography, electron microscopy, speech
processing, and astronomical imaging. A wide variety of methods exist for retrieving phase, yet most do not allow for much noise in the observations. A phase retrieval method was recently developed [Friedlander, 2016] which handles noise, leading to an eigenvalue optimization problem. This underlying eigenvalue problem has a unique structure which we exploit using modern eigenvalue methods to increase the efficiency of the phase retrieval process.

### 2.7 Computational Mathematics

## Thomas Strohmer

Title: Mathematics of Data Science
Abstract: I will talk about some recent research my collaborators and I have conducted in the field of data science. Topics include blind deconvolution, convex and nonconvex optimization, data clustering, and deep learning.

### 2.8 Machine Learning

## Kirill Paramonov

Title: Graphlet enumeration in large graphs
Abstract: Graphlets are connected induced subgraphs of small size. Counting the number of graphlets of a certain type yields an important statistic for analyzing many social graphs. During the talk, I introduce the problem and talk about different issues that may arise while solving it. In particular, I?ll introduce the Markov Chain Monte Carlo approach for estimation of the graphlet count statistic.

### 2.9 Mathematical Biology

## Robert Guy

Title: TBA
Abstract: TBA

### 2.10 Combinatorics

## Chaim Even Zohar

Title: Patterns in Random Permutations
Abstract: Every $k$ entries in a permutation of order $n$ can have one of $k$ ! different relative orders, called patterns. How many times does each pattern
occur in a large random permutation? We analyze the distribution of pattern densities, using representations of the symmetric group.
